Salesforce File Management Challenge

- There is nothing wrong with using Salesforce Files if you don't have too many of them or a large org.
- Salesforce allots 10 GB of file storage per org + 2GB/user
- In the Enterprise-size company, this translates into gigabytes, even terabytes of storage
- For small companies this is a challenge
- Use Cases:
  - *Lots of attachments are submitted with Leads via FormAssembly.*
  - *Numerous files are attached to Email-to-Case*
  - *Community Users upload a lot of files*

- Problem:
  - Salesforce storage comes at a premium and you can quickly run out of file storage space.

- Solution:
  - Off-platform file storage

- Challenge:
  - How to keep records and files in sync?
  - How does one move incoming files off-platform automatically?
  - What happens to the files that are offloaded?

- S3-Link connects a Salesforce org to AWS S3 buckets and automates file offloading to S3
- S3-Link then deletes the files in Salesforce, thereby keeping Salesforce storage lean
- S3-Link automates the creation of pre-signed links for on-demand file retrieval from S3

S3-Files Component on a Lightning Page

- S3-Files can be accessed natively and intuitively from within Salesforce

Large File Migration

- There is a limitation on the AWS side which prevents the migration of files over 11MB via API
- There is a custom object/code functionality which can be added upon request (additional charges may apply), which facilitates semi-automatic upload of files to S3
- Best practice is to keep the files under 11MB
